Profile

Computer Engineering graduate. I build my projects with AI coding agents (Claude Code): I set the requirements and product decisions, split the work across agents, and verify the result with automated tests and review. With this approach I have built two Turkish desktop AI assistants, a social network and a stock-data system. I am looking for a junior role where I can gain experience in a team.

Experience

- **Ünver Group & Ünver Otomotiv**
  Software Development Intern *Sep 2024 - Nov 2024*
  - Built, with AI assistance, a chatbot using Gemini API, LangChain and C# that turns natural-language questions into SQL queries and returns HTML/Excel output.

Projects

Code written by AI coding agents; design, requirements and verification are mine.

- **Jarvis and Artemis** **github.com/UmutErayAltay/artemis-ai-assistant**
  Turkish desktop AI assistants (Python)
  - Designed a tool-calling architecture for a voice-controlled PC assistant in which the model only decides and ordinary code does the work; required extra user confirmation for sensitive actions.
  - Defined the requirements for speech recognition that understands mixed Turkish-English speech and for natural female-voice speech output, and tested them on my own machine.
  - Using lessons from Artemis, redesigned Jarvis security-first: a single safety gate, content tracking against prompt injection, undo and an audit log; about 750 automated tests, CI on Windows and Ubuntu.
- **claude-openrouter** **github.com/UmutErayAltay/claude-openrouter**
  Model bridge for Claude Code (TypeScript)
  - Built a local proxy that lets Claude Code use other models on OpenRouter, with a spending cap, alerts and a usage dashboard (about 490 tests).
- **Social network** **github.com/UmutErayAltay/Sosyal-Medya-Web**
  Web (Flask, Supabase) and Android client
  - Built a social network with messaging, stories, polls and notifications, plus an Android app on the same API. About 310 backend tests and Playwright end-to-end tests.
- **BorsaSite** **github.com/UmutErayAltay/BorsaSite**
  BIST/US stock data and prediction system (Python)
  - Built a data pipeline that collects price, news and KAP (Turkish disclosure) data, scores news sentiment with FinBERT and Turkish BERT, and predicts with XGBoost.
  - Tested the strategy with a walk-forward backtest including commission and slippage; it did not beat buy-and-hold, and I reported that result openly.
- **Other:** teklifkit (FastAPI, multi-tenant quotes/invoices) · kule (developer control panel) · house price prediction (ML notebook)

Education

- **Burdur Mehmet Akif Ersoy University** **GPA 3.4/4.0**
  BSc Computer Engineering *2020-2024*

Skills

- **AI-assisted development**: Claude Code, task definition, agent orchestration, test-driven verification
- **LLM applications**: tool calling, MCP, Ollama, OpenRouter and Anthropic APIs, prompt-injection awareness
- **Programming**: Python (basic). **Technologies used in projects**: FastAPI, Flask, PostgreSQL/Supabase, TypeScript, pytest, Playwright, GitHub Actions, Docker, Git

Additional Information

- **Languages:** Turkish (native), English (A2)
- **Military service:** Reserve officer; discharge on 5 November 2026, available from that date
